**The Epworth Sleepiness Scale**

The Epworth Sleepiness Scale is widely used in the field of sleep medicine as a subjective measure of a patient's sleepiness. The test is a list of eight situations in which you rate your tendency to become sleepy on a scale of 0 (no chance of dozing) to 3 (high chance of dozing). When you finish the test, add up the values of your responses. Your total score is based on a scale of 0 to 24. The scale estimates whether you are experiencing excessive sleepiness that possibly requires medical attention.

- No chance of dozing =0
- Slight chance of dozing =1
- Moderate chance of dozing =2
- High chance of dozing =3

Situation	Chance of Dozing
Sitting and reading	
Watching TV	
Sitting inactive in a public place (e.g., a theater or a meeting)	
As a passenger in a car for an hour without a break	
Lying down to rest in the afternoon when circumstances permit	
Sitting and talking to someone	
Sitting quietly after a lunch without alcohol	
In a car, while stopped for a few minutes in traffic	

Total Score = \_\_\_\_\_

**Analyze Your Score:**

**0-7:** It is unlikely that you are abnormally sleepy.

**8-9:** You have an average amount of daytime sleepiness.

**10-15:** You may be excessively sleepy depending on the situation. You may want to consider seeking medical attention.

**16-24:** You are excessively sleepy and should consider seeking medical attention.
